1. Summary

This week I wrote the **Software Requirements Specification (SRS)** in the IEEE 830 format. It describes exactly what the app must do (functional requirements), how well it must do it (non-functional requirements), and how users interact with it (use cases).

14
functional requirements

10
use cases + diagram

10
measurable quality targets

Task from the plan	Status
Write a formal IEEE 830 SRS document	Done
Write formal use case specifications	Done — 10 use cases
Draw the system use case diagram	Done (section 4)
Set measurable non-functional requirements (speed, security, uptime)	Done — 10 targets

2. SRS structure (IEEE 830)

1. **Introduction** — purpose, scope, definitions (e.g. *deduction*, *OCR*, *self-employment tax*), references.
2. **Overall description** — who the users are, where the app runs, limits and assumptions.
3. **Specific requirements** — functional requirements, tax rules, outside systems, quality targets.
4. **Use cases** — step-by-step descriptions of how each user goal is reached.

Scope in one line: a web app where freelancers scan receipts, track expenses and income, send invoices, estimate quarterly tax and download tax-ready PDF reports. It does **not** file tax returns, move money, or connect to bank accounts.

3. Functional requirements

ID	The system shall…
FR-01	Let users sign up, log in and log out securely; each user sees only their own data
FR-02	Let users add, edit and delete expenses with date, vendor, amount, category, business-use % and notes
FR-03	Let users upload a receipt photo and read vendor, date and total from it using Tesseract OCR

ID	The system shall…
FR-04	Suggest a tax category for each expense automatically (e.g. hardware, internet, travel, software, meals)
FR-05	Calculate the deductible amount: amount × business-use % × category factor (meals 50%)
FR-06	Let users record income by hand, and add income automatically when an invoice is marked paid
FR-07	Let users manage clients and create invoices with line items, tax, discount and auto numbers (INV-0001)
FR-08	Track invoice status: Draft → Sent → Paid, with Overdue and Void
FR-09	Generate invoices and tax summary reports as PDF files (PDFKit)
FR-10	Estimate quarterly tax: self-employment tax, income tax, QBI deduction, safe-harbour option, due dates
FR-11	Let users log estimated tax payments and show the remaining amount
FR-12	Show a dashboard with totals, charts, unpaid invoices and upcoming deadlines
FR-13	Support search, filters, sorting, CSV import/export and bulk actions on lists
FR-14	Provide an admin portal (admins only) to manage users and view platform statistics

4. Use case diagram

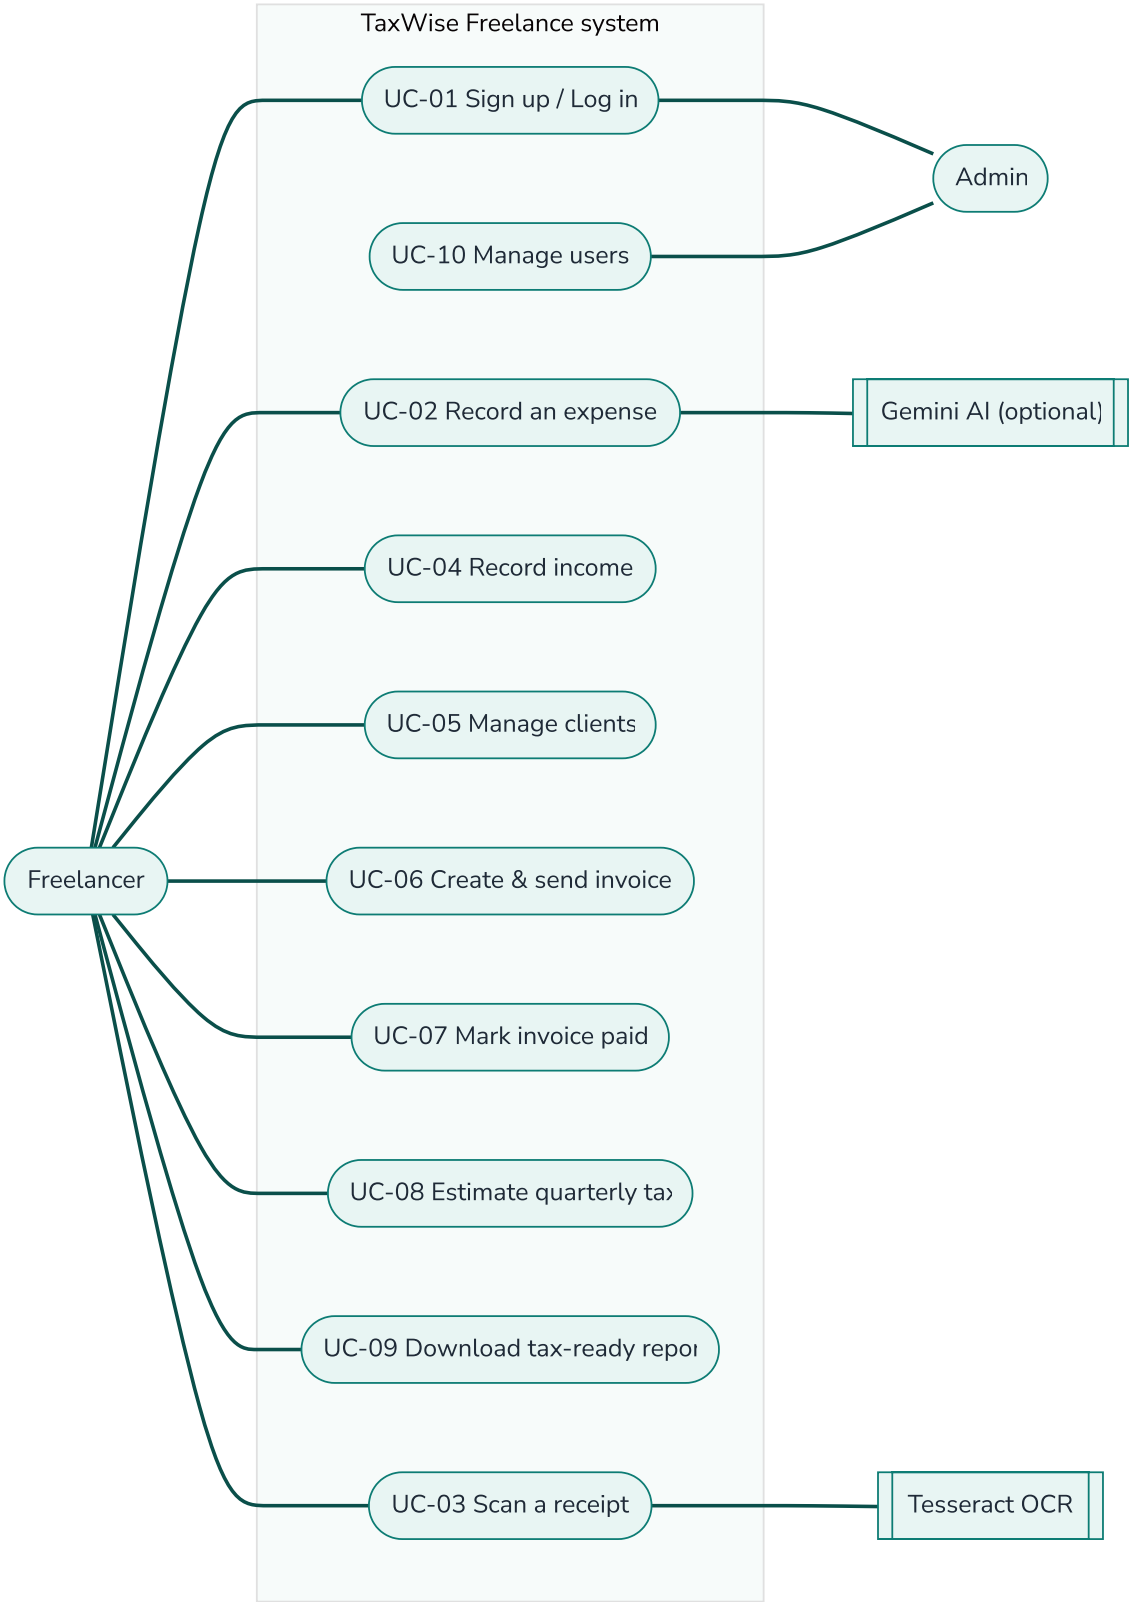

Figure 1 — System use case diagram (UC-03 Scan a receipt includes UC-02 Record an expense)

5. Use case specifications

Each use case was written with: actor, starting condition, main steps, other paths, and end result. Two examples:

UC-03 Scan a receipt

Actor: Freelancer · **Before:** user is logged in

1. User clicks **Scan receipt** and uploads a photo.
2. System reads the text with Tesseract OCR.
3. System finds vendor, date and total, and suggests a category.
4. User checks the details and clicks **Save**.
5. System saves the expense with the receipt image.

Other path: photo unreadable → system shows a message and the user types the details manually.

UC-07 Mark invoice paid

Actor: Freelancer · **Before:** invoice is Sent or Overdue

1. User opens the invoice and clicks **Mark as paid**.
2. System sets the status to Paid with the payment date.
3. System adds one income entry for the invoice total.
4. Dashboard and tax estimate update.

Other path: user clicks twice → still only one income entry is created.

ID	Use case	Actor
UC-01	Sign up / Log in	Freelancer, Admin
UC-02	Record an expense	Freelancer
UC-03	Scan a receipt	Freelancer
UC-04	Record income	Freelancer
UC-05	Manage clients	Freelancer
UC-06	Create & send an invoice	Freelancer
UC-07	Mark an invoice paid	Freelancer
UC-08	Estimate quarterly tax & log payments	Freelancer
UC-09	Download tax-ready summary report	Freelancer
UC-10	Manage users and view statistics	Admin

6. Non-functional requirements (measurable)

ID	Area	Target
NFR-01	Speed	95% of normal page/API requests answer in **under 300 ms**
NFR-02	Receipt scanning	A receipt is read in **under 10 seconds**; if it fails, manual entry still works
NFR-03	Uptime	App available **99.5%** of the time each month, checked by a health endpoint
NFR-04	Password security	Passwords stored only as **bcrypt hashes (cost 12)**; never in plain text
NFR-05	Sessions	Login token (JWT) in a secure, httpOnly cookie that expires after **7 days**
NFR-06	Attack protection	Max **5 login attempts per 15 minutes**; protection against OWASP Top 10 risks
NFR-07	Data privacy	A user can **never** read or change another user's data
NFR-08	Mobile friendly	Works on screens from **320 px** (phone) to **1440 px** (desktop)
NFR-09	Testing	At least **70% test coverage** on the core logic
NFR-10	Accuracy	All money stored in **whole cents** so totals never have rounding errors

7. Challenges and solutions

Challenge	Solution
Tax rules have many small details	Wrote exact formulas and example numbers in the SRS so they can be tested
OCR is not always correct	Made it a rule that the user always confirms scanned data (UC-03)
A double-click could record income twice	Added a requirement that marking paid is safe to repeat (UC-07)

8. Plan for next week (Week 3)

- Draw the 3-tier architecture diagram (client, API server, database).
- Draw Data Flow Diagrams (Level 0 and Level 1).
- Define the system boundaries and choose the cloud services.
